

# Assignment JC2

---

1. Choose one person from your team. He/she will be called "code maintainer".
2. Task 1 should be done before any other task.
3. The code maintainer has more responsibilities than others, but the team members may work/discuss together to complete the code maintainer's task.

## Task 1

This task should be done by *the code maintainer*.

1. Create a new public repo called **bcd-team-project** for your team.
2. Invite **@hisplan** to this repo as collaborator.
3. Create **README.md**, and add a member table that will contain the information about all the team members. Each of your team member should fill up this table in the next task, not the code maintainer.

Below is the example member table. The first row should have the code maintainer's information.

Name	Student ID	GitHub URL
Matthew	2200011	<a href="https://github.com/matthew/bcd-team-project">github.com/matthew/bcd-team-project</a>
...	...	...
...	...	...
...	...	...

(\*) GitHub URL must be a clickable hyperlink.

## Task 2

This task should be done by *each team member*.

1. Fork the code maintainer's **bcd-team-project** repo.
2. Clone the repo onto your computer so that you can edit files.
3. Open **README.md**, add your name, student ID, and the URL of your forked **bcd-team-project** to the member table.
4. Commit and push the changes to the repo.
5. Make a PR (pull request).

## Task 3

This task should be done by *the code maintainer*.

1. You will get total three PR requests from each of your team member. You should handle all three PR requests, that is, merge their changes into your repo.

2. Once all merged, the member table in **README.md** should look something like this:

<b>name</b>	<b>student ID</b>	<b>GitHub URL</b>
Matthew	2200011	github.com/matthew/bcd-team-project
Mark	2200012	github.com/mark/bcd-team-project
Luke	2200013	github.com/luke/bcd-team-project
John	2200014	github.com/john/bcd-team-project

## Task 4

This task should be done by *each team member*.

1. Once Task 3 is done, you should have your repo up-to-date with the upstream. That is, the member table in **README.md** in your repo should look something like this. All the team members should have exactly the same member table.

<b>name</b>	<b>student ID</b>	<b>GitHub URL</b>
Matthew	2200011	github.com/matthew/bcd-team-project
Mark	2200012	github.com/mark/bcd-team-project
Luke	2200013	github.com/luke/bcd-team-project
John	2200014	github.com/john/bcd-team-project
